

# Order Sorted Algebra

Daniel Găină

Japan Advanced Institute of Science and Technology

March 8, 2008

# Introduction

- There are many examples where all items of one sort are necessarily also items of some other sort.
- Every natural number is an integer, and every integer is a rational. We may write this symbolically

$$\textit{Natural} \leq \textit{Integer} \leq \textit{Rational}$$

- Associating to each sort name a meaning, i.e. semantic denotation, the sub-sort relations appear as set-theoretic inclusion.

$$\mathbb{N} \subseteq \mathbb{Z} \subseteq \mathbb{Q}$$

# Introduction

- Sort names like Natural and Rational are *syntactic*, formalized with *order sorted signatures*,
- while their interpretations  $\mathbb{N}$  and  $\mathbb{Q}$  are *semantic*, formalized with *order sorted algebras*.
- This area of mathematics is called **Order Sorted Algebras** (abbrev. **OSA**).

# Some Motivation

- A related topic is **overloading** which allows a single symbol to be used for different operations.
- we can add  $2 + 2$  (two naturals), or  $-2/3 + -2$  (a rational and a integer), or  $2 + 3/25$  (a natural and a rational).
- The flexibility comes from having both
  - an overloaded operation symbol  $+$ , and
  - a sub-sort relation among naturals, integers and rationals such that we always get the same result for the same arguments ( $+$  is **sub-sort polymorphic**).

# Some Motivation

- **polymorphic** express the use of the same operation symbol with different meanings in a programming language.
- One may distinguish several forms of polymorphism based on semantic relationship that holds between the different interpretations of an operation symbol

# Some Motivation

- **strong ad hoc polymorphism** - an op. sym. has semantically unrelated uses.
- **multiple representation** - the uses are related semantically, but the representations may be different
- **sub-sort polymorphism** - different instances of an op. sym. are related by the subset inclusion s.t. the result does not depend on the instance used.
- **parametric polymorphism** - supported in CafeOBJ by parameterized objects, such as `LIST[X]`.

# Signatures and Terms

An order sorted signature  $(S, \leq, F)$  consists of

- a many sorted signature  $(S, F)$
- a partial ordering  $\leq$  on  $S$  such that the following monotonicity condition is satisfied

$$\sigma \in F_{w_1, s_1} \cap F_{w_2, s_2} \text{ and } w_1 \leq w_2 \text{ imply } s_1 \leq s_2$$

The set  $T_F$  of terms is defines recursively by the following:

- $F_{[], s} \subseteq (T_F)_s$
- $s_1 \leq s_2$  implies  $(T_F)_{s_1} \subseteq (T_F)_{s_2}$ ,
- $t_i \in (T_F)_{s_i}$  and  $\sigma \in F_{s_1 \dots s_n, s}$  imply  $\sigma(t_1, \dots, t_n) \in (T_F)_s$

# Example in CafeOBJ

```
mod! LIST {  
  [ NeList < List ]  
  [ Nat ]  
  op 0 : - > Nat  
  op s_ : Nat - > Nat  
  op nil : - > List .  
  op cons : Nat List - > NeList .  
  op car : NeList - > Nat .  
  op cdr : NeList - > List . }  
}
```

# Models and Homomorphisms

Given an order sorted signature  $(S, \leq, F)$ , an **order sorted  $(S, \leq, F)$ -algebra** is a many sorted  $(S, F)$ -algebra  $M$  such that

- $s_1 \leq s_2$  implies  $M_{s_1} \subseteq M_{s_2}$
- $\sigma \in F_{w_1, s_1} \cap F_{w_2, s_2}$  and  $w_1 \leq w_2$  imply  $M_{\sigma}^{w_1, s_1} = M_{\sigma}^{w_2, s_2}$  on  $M^{w_1}$ .

Given order sorted  $(S, \leq, F)$ -algebras  $M, M'$ , an **order sorted  $(S, \leq, F)$ -homomorphism**  $h: M \rightarrow M'$  is a many sorted  $(S, F)$ -homomorphism  $h: M \rightarrow M'$  such that

- $s_1 \leq s_2$  implies  $h_{s_1} = h_{s_2}$  on  $M_{s_1}$

# Regular Signatures and Initiality

An order sorted signature  $(S, \leq, F)$  is **regular** iff for each  $\sigma \in F_{w_1, s_1}$  and each  $w_0 \leq w_1$  there is a unique least element in the set  $\{(w, s) \mid \sigma \in F_{w, s}, \text{ and } w_0 \leq w\}$ .

## Proposition

*If  $(S, \leq, F)$  is regular then for each  $t \in T_F$  there is a least sort  $s \in S$  such that  $t \in (T_F)_s$ . This sort is denoted  $LS(t)$ .*

# An Example of Non-Regular Signature

```
mod! TEST {  
  [  $s_1 < s_3$  ]  
  [  $s_2 < s_4$  ]  
  [  $s_5$  ]  
  op  $a$  :  $- > s_1$   
  op  $b$  :  $- > s_2$   
  op  $f$  :  $s_1 s_4 - > s_5 .$   
  op  $f$  :  $s_3 s_2 - > s_5 . }$ 
```

# Locally Filtered Signatures and Congruence Relations

- $s_1$  and  $s_2$  are in the same **connected component** of  $S$  iff  $s_1 \equiv s_2$ , where  $\equiv$  is the least equivalence relation on  $S$  that contains  $\leq$ .
- A partial ordering  $(S, \leq)$  is **filtered** iff for all  $s_1, s_2 \in S$  there is some  $s \in S$  such that  $s_1 \leq s$  and  $s_2 \leq s$ .
- A partial ordering  $(S, \leq)$  is **locally filtered** iff every connected component of it is filtered.
- An order sorted signature  $(S, \leq, F)$  is **locally filtered** iff  $(S, \leq)$  is locally filtered.

# Locally Filtered Signatures and Congruence Relations

- An **order sorted**  $(S, \leq, F)$ -**congruence** on a  $(S, \leq, F)$ -algebra  $M$  is a many-sorted  $(S, F)$ -congruence such that if  $s \leq s'$  and  $a, a' \in M_s$  then  $a \equiv_s a'$  iff  $a \equiv_{s'} a'$ .
- Constr. of the **quotient** of  $M$  by  $\equiv$ . For each  $C$  we define:
  - $M_C = \bigcup_{s \in C} M_s$
  - the equiv. rel.  $\equiv_C$  by  $a \equiv_C a'$  iff  $a \equiv_s a'$  for some  $s \in C$ .
  - $(M/\equiv)_s = q_C(M_s)$  where  $q_C : M_C \rightarrow (M_C)/\equiv_C$ ,  $q_C(a) = [a]$
  - $(M/\equiv)_\sigma = ([a_1], \dots, [a_n]) = [M_\sigma(a_1, \dots, a_n)]$

# Example

```
mod! TEST {  
  [  $s_1 < s_3$  ]  
  [  $s_2 < s_3$  ]  
  ops  $a\ b : - > s_1$   
  op  $c : - > s_3$   
  op  $f : s_1 - > s_1 .$   
  eq  $c = a .$   
  eq  $c = b .$   
}  
[ $a$ ] $_{s_1} = [a]_{s_3} = \{a, b, c\}$ , [ $b$ ] $_{s_1} = [b]_{s_3} = \{a, b, c\}$ , [ $c$ ] $_{s_1} = \{a, b, c\}$   
( $T_{TEST} / \equiv$ ) $_{s_3} = \emptyset$   
 $f([a]) = [f(a)] = \{f(a), f(b)\}$ 
```

# Coherent signatures and Equations

- A signature is **coherent** iff it is both locally filtered and regular.
- An order sorted  $(S, \leq, F)$ -**equation** is a triple  $\langle X, t_1, t_2 \rangle$  where  $X$  is an  $S$ -indexed set and  $t_1, t_2 \in T_{F \cup X}$  such that  $LS(t_1)$  and  $LS(t_2)$  are in the same connected component of  $(S, \leq)$ . We will write  $(\forall X)t_1 = t_2$ .
- A **conditional**  $(S, \leq, F)$ -**equation** is a quadruple  $\langle X, t_1, t_2, C \rangle$ , where  $\langle X, t_1, t_2 \rangle$  is a  $(S, \leq, F)$  equation and  $C$  is a (finite) set of pairs  $\langle u, v \rangle$  such that  $\langle X, u, v \rangle$  is a  $(S, \leq, F)$ -equation. We will write  $(\forall X)t_1 = t_2$  if  $C$ .

# System of (Proof) Rules and Entailment Systems

A **system of (proof) rules**  $(\mathbf{Sig}, \mathbf{Sen}, Rl)$  consists of

- a category of "signatures"  $\mathbf{Sig}$ ,
- a "sentence functor"  $\mathbf{Sen} : \mathbf{Sig} \rightarrow \mathcal{Set}$
- a family of relations  $Rl = (Rl_{\Sigma})_{\Sigma \in |\mathbf{Sig}|}$  between sets of sentences  $\vdash_{\Sigma} \subseteq \mathcal{P}(\mathbf{Sen}(\Sigma)) \times \mathcal{P}(\mathbf{Sen}(\Sigma))$  for all  $\Sigma \in |\mathbf{Sig}|$ .

An **entailment system**  $(\mathbf{Sig}, \mathbf{Sen}, \vdash)$  is just a systems of rules s. t. for each  $\Sigma \in |\mathbf{Sig}|$ ,  $\vdash_{\Sigma}$  has the following prop.:

- *anti-monotonicity*:  $E_1 \vdash_{\Sigma} E_2$  if  $E_2 \subseteq E_1$ ,
- *transitivity*:  $E_1 \vdash_{\Sigma} E_3$  if  $E_1 \vdash_{\Sigma} E_2$  and  $E_2 \vdash_{\Sigma} E_3$ , and
- *unions*:  $E_1 \vdash_{\Sigma} E_2 \cup E_3$  if  $E_1 \vdash_{\Sigma} E_2$  and  $E_1 \vdash_{\Sigma} E_3$

We call  $\vdash_{\Sigma}$  the entailment relation associated to the signature  $\Sigma$ .

# Proof rules for **AOSA**

- $(R)\emptyset \vdash t = t$  for each term  $t$
- $(S)t = t' \vdash t' = t$  for any terms  $t, t'$
- $(T)\{t = t', t' = t''\} \vdash t = t''$  for any terms  $t, t', t''$
- $(F)\{t_i = t'_i \mid 1 \leq i \leq n\} \vdash \sigma(t_1, \dots, t_n) = \sigma(t'_1, \dots, t'_n)$  for any  $\sigma \in F$

## Proposition

*For each set  $E$  of quantifier free  $(S, \leq, F)$ -equations we have that  $(T_F)/\equiv_E \models t = t'$  iff  $E \vdash t = t'$  and **AOSA** with the above system of proof rules is sound and complete.*

# Entailment Systems with Implications

An entailment system  $(\mathbf{Sig}, \mathbf{Sen}, \vdash)$  has (finitary) implications if for each set of  $\Sigma$ -sentences  $E$  and any  $\Sigma$ -sentence  $e$  if  $C$ ,

$$E \vdash e \text{ if } C \text{ iff } E \cup C \vdash e$$

## Proposition

*The entailment system with implications freely generated by the systems of rules for **AOSA** is sound and complete for the quantifier free part of **OSA**.*

# Entailment Systems with Universal Quantification

An entailment system  $(\mathbf{Sig}, \mathbf{Sen}, \vdash)$  has universal  $\mathcal{D}$ -quantification, for a sub-category  $\mathcal{D} \subseteq \mathbf{Sig}$  of signature morphisms if the entailment system satisfies the following property (also called the meta-rule of 'Generalization').

$$\Gamma \vdash_{\Sigma} (\forall \chi) e' \text{ iff } \chi(\Gamma) \vdash_{\Sigma'} e'$$

for each set of sentences  $\Gamma \subseteq \mathbf{Sen}(\Sigma)$  and any sentence  $(\forall \chi) e' \in \mathbf{Sen}(\Sigma)$ , where  $\chi : \Sigma \rightarrow \Sigma' \in \mathcal{D}$ .

# Proof Rules for OSA

## Theorem

*Entailment system for **OSA** is obtained as the free entailment system*

- *with universal quantification and*
- *with implication at the quantifier-free level*

*generated by*

- $(R)\emptyset \vdash t = t$  for each term  $t$
- $(S)t = t' \vdash t' = t$  for any terms  $t, t'$
- $(T)\{t = t', t' = t''\} \vdash t = t''$  for any terms  $t, t', t''$
- $(F)\{t_i = t'_i \mid 1 \leq i \leq n\} \vdash \sigma(t_1, \dots, t_n) = \sigma(t'_1, \dots, t'_n)$  for any  $\sigma \in F$
- $(Subst)(\forall Y)\rho \vdash (\forall X)\theta(\rho)$  for any  $(S, \leq, F)$ -sentence  $(\forall Y)\rho$  and for any substitution  $\theta : Y \rightarrow T_F(X)$ .
