A Two-grid method

Wien, 17 October 2007 1 / 28

The control problem

$$\left\{ \begin{array}{ll} u'' - \Delta u = 0 & \text{ in } \Omega \times (0,T), \\ u = v \mathbf{1}_{\Gamma_0}(x) & \text{ on } \Gamma \times (0,T), \\ u(0,x) = y^0(x), \ u_t(0,x) = y^1(x) & \text{ in } \Omega, \end{array} \right.$$

$$\begin{split} \Omega \text{ is the unit square } \Omega &= (0,1) \times (0,1) \\ \Gamma_0 &= \{(x_1,1): \ x_1 \in (0,1)\} \cup \{(1,x_2): \ x_2 \in (0,1)\}. \end{split}$$

Given $T > 2\sqrt{2}$ and $(y^0, y^1) \in L^2(\Omega) \times H^{-1}(\Omega)$ there exists a control function $v \in L^2((0, T) \times \Gamma_0)$ such that the solution u = u(t, x) satisfies

$$u(T) = u_t(T) = 0.$$

- 4 週 ト - 4 三 ト - 4 三 ト

The adjoint problem

Wave equation on the unit square with Dirichlet boundary conditions

$$\begin{cases} \begin{array}{ll} u_{tt} - \Delta u = 0 & \text{in } Q = \Omega \times (0, T), \\ u = 0 & \text{on } \Sigma = \partial \Omega \times (0, T), \\ u(x, T) = u^0(x), \ u_t(x, T) = u^1(x) & \text{in } Q = \Omega. \end{array} \end{cases}$$

$$(u_0, u_1) \in H_0^1(\Omega) \times L^2(\Omega) \Rightarrow$$
$$u \in C([0, T], H_0^1(\Omega)) \cap C^1([0, T], L^2(\Omega)).$$

Conservation of energy

$$E(t) = \frac{1}{2} \int_{\Omega} [|u_t(x,t)|^2 + |\nabla u(x,t)|^2] dx$$

Ioan Liviu Ignat (IMAR & UAM)

For any $T>2\sqrt{2}$ there exists C(T)>0 such that

$$\|(u^0, u^1)\|_{H^1_0(\Omega) \times L^2(\Omega)}^2 \le C(T) \int_0^T \int_{\Gamma_0} \left| \frac{\partial u}{\partial n} \right|^2 d\sigma dt$$

for any $(u^0, u^1) \in H^1_0(\Omega) \times L^2(\Omega)$ where u is the solution of adjoint problem with final data (u^0, u^1) .

イロト 不得下 イヨト イヨト 二日

Once the observability inequality is known the control is easy to characterize. Following J.L. Lions's HUM (Hilbert Uniqueness Method), the control is

$v(t) = \partial_n u,$

where u is the solution of the adjoint system corresponding to final data $(u_0, u_1) \in H_0^1(\Omega) \times L^2(\Omega)$ minimizing the functional

$$J(u_0, u_1) = \frac{1}{2} \int_0^T \int_{\Gamma_0} |\partial_n u(t)|^2 + \int_\Omega y^0 u_t(0) dx - \langle y^1, u(0) \rangle_{H^{-1} \times H^1_0}$$

in the space $H_0^1(\Omega) \times L^2(\Omega)$.

イロッ イボッ イヨッ イヨッ 二日

The idea of approximating the HUM control v for the continuous problem is to consider the following discrete problem

$$\left\{ \begin{array}{ll} u_h'' - \Delta_h u_h = 0 & \text{ in } \Omega_h \times (0,T), \\ u_h = v_h \mathbf{1}_{\Gamma_{0h}} & \text{ on } \Gamma_h \times (0,T), \\ u_h(0) = y_h^0, \; \partial_t u_h(0) = y_h^1 & \text{ in } \Omega_h. \end{array} \right.$$

where the initial data (y_h^0, y_h^1) are approximations of (y^0, y^1) .

イロト 不得 トイヨト イヨト 二日

Semi-discretization of the adjoint problem

$$\begin{cases} u_{jk}'' - (\Delta_h u)_{jk} = 0, \ 0 < t < T, \ j = 0, ..., N; \ k = 0, ..., N, \\ u_{jk} = 0, \ 0 < t < T, \ j = 0, ..., N + 1; \ k = 0, ..., N + 1, \\ u_{jk}(0) = u_{jk}^0, \ u_{jk}'(0) = u_{jk}^1, \ j = 0, ..., N + 1; \ k = 0, ..., N + 1. \end{cases}$$
(1)

Discrete energy is preserved $E_{h}(t) = \frac{h^{2}}{2} \sum_{j,k=0}^{N} \left[|u'_{jk}(t)|^{2} + \left| \frac{u_{j+1,k}(t) - u_{jk}(t)}{h} \right|^{2} + \left| \frac{u_{j,k+1}(t) - u_{jk}(t)}{h} \right|^{2} \right]$

Ioan Liviu Ignat (IMAR & UAM)

Discrete version of the energy observed on the boundary

$$\int_0^T \int_{\Gamma_0} \left| \frac{\partial u}{\partial n} \right|^2 d\sigma dt \sim \int_0^T \left[h \sum_{j=1}^N \left| \frac{u_{jN}}{h} \right|^2 + h \sum_{k=1}^N \left| \frac{u_{Nk}}{h} \right|^2 \right] dt.$$

Notation

$$\int_{\Gamma_{0h}} |\partial_n^h u|^2 d\Gamma_{0h} := h \sum_{j=1}^N \left| \frac{u_{jN}}{h} \right|^2 + h \sum_{k=1}^N \left| \frac{u_{Nk}}{h} \right|^2.$$

Question

$$E_h(0) \le C_h(T) \int_0^T \int_{\Gamma_{0h}} |\partial_n^h \overline{u}|^2 d\Gamma_{0h} dt?$$

Answer: YES BUT, FOR ALL T > 0 (!!!!!)

$$C_h(T) \to \infty, \ h \to 0.$$

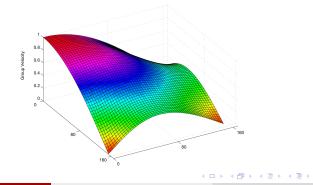

Following the same arguments as in the continuous case, the control function v_h diverges

$$\|v_h\|_{L^2((0,T)\times\Gamma_{0h})}\to\infty$$

Group Velocity

$$\begin{split} u(t,x) &= e^{i(\omega t - \xi x)} \to \omega_h(\xi) = \pm (\sin^2(\frac{\xi_1 h}{2}) + \sin^2(\frac{\xi_2 h}{2}))^{1/2} \\ \text{Group velocity } C_h(\xi) &= \nabla_{\xi} \omega_h(\xi) \end{split}$$

$$C_h(\xi) = \frac{1}{2} (\sin(\xi_1 h), \sin(\xi_2 h)) / (\sin^2 \frac{\xi_1 h}{2} + \sin^2 \frac{\xi_2 h}{2})^{1/2}$$

Spectral Analysis

Eigenvalue problem associated to (1)

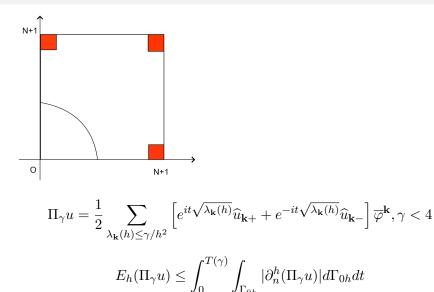

$$\left\{ \begin{array}{l} -\frac{\varphi_{j+1,k} + \varphi_{j-1,k} - 2\varphi_{jk}}{h^2} - \frac{\varphi_{j,k+1} + \varphi_{j,k-1} - 2\varphi_{jk}}{h^2} = \lambda \varphi_{jk} \\ j = 1, ..., N; \ k = 1, ..., N, \\ \varphi_{jk} = 0, \ j = 0, ..., N + 1; \ k = 0, ..., N + 1. \end{array} \right.$$

Eigenvalues: $\lambda_{\mathbf{k}}(h) = \frac{4}{h^2} \left[\sin^2 \left(\frac{k_1 \pi h}{2} \right) + \sin^2 \left(\frac{k_2 \pi h}{2} \right) \right], \ \mathbf{k} = (k_1, k_2)$ **Eigenvectors**: $\overline{\varphi}_{\mathbf{i}}^{\mathbf{k}} = \sin(j_1 k_1 \pi h) \sin(j_2 k_2 \pi h)$

$$\overline{u}(t) = \frac{1}{2} \sum_{\mathbf{k}} \left[e^{it\sqrt{\lambda_{\mathbf{k}}(h)}} \widehat{u}_{\mathbf{k}+} + e^{-it\sqrt{\lambda_{\mathbf{k}}(h)}} \widehat{u}_{\mathbf{k}-} \right] \overline{\varphi}^{\mathbf{k}}$$

New Idea : Low frequency estimates + Semi-classical decomposition following the level sets of the frequencies

Main Result: Let \overline{u} be a solution of (1) and $\gamma > 0$ be such that

 $E_h(\overline{u}) \leq C E_h(\Pi_{\gamma}\overline{u}).$

Let us assume the existence of a time $T(\gamma)$ such that for all $T > T(\gamma)$ there exists a constant C(T), independent of h, such that

$$E_h(\overline{v}) \le C(\gamma, T) \int_0^T \int_{\Gamma_{0h}} |\partial_n^h \overline{v}(t)|^2 d\Gamma dt$$

for all $\overline{v} \in \Pi_{\gamma}$. Then for all $T > T(\gamma)$ there exists a constant $C_1(T)$, independent of h, such that

$$E_h(\overline{u}) \le C_1(T) \int_0^T \int_{\Gamma_{0h}} |\partial_h^h \overline{u}|^2 d\Gamma_{0h} dt$$

Two-grid Method in 2-d

Fine and Coarse Grids G^h and G^{4h} . N = 11

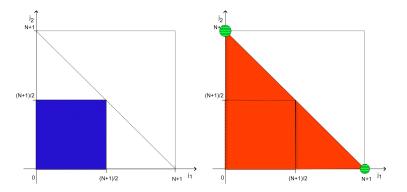

Energy estimates for two-grid data

∃ ► < ∃ ►</p>

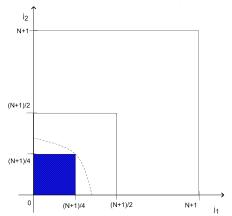

Why not using ratio 1/2 for the two-grids?

The relevant zone of frequencies intersects a level set of the phase velocity for which the group velocity vanishes at some critical points.

 $E_h(\overline{u}) \le 4E_h(\Pi_{1/2}^{\infty}\overline{u}) \le 4E_h(\Pi_4\overline{u})$

When using the mesh ratio 1/4 this pathology disappears:

 $E_h(\overline{u}) \le 16E_h(\prod_{1/4}^{\infty}\overline{u}) \le 16E_h(\prod_{8\sin^2(\pi/8)}\overline{u})$

Ioan Liviu Ignat (IMAR & UAM)

Wien, 17 October 2007 19 / 28

Application to a two-grid method

Theorem

Let be T > 4. There exists a constant C(T) such that

$$E_h(\overline{u}) \le C(T) \int_0^T \int_{\Gamma_{0h}} |\partial_n^h \overline{u}|^2 d\Gamma_{0h} dt$$

holds for all solutions of (1) with $(\overline{u}^0, \overline{u}^1) \in V^h \times V^h$, uniformly on h > 0, V^h being the class of the two-grid data obtained with ratio 1/4.

 $T_0 = 4$ is not optimal one. Its depends by the optimality of the time for the class $\Pi_{8 \sin^2(\pi/8)}$ Analysis of the group velocity: expected time $T_0 = \frac{2\sqrt{2}}{\cos(\pi/8)}$

20 / 28

Main difficulty

$$E_{h}(\overline{u}) \leq 16E_{h}(\Pi_{1/4}^{\infty}\overline{u}) \leq C(T) \int_{0}^{T} \int_{\Gamma_{0h}} |\partial_{n}^{h}\Pi_{1/4}^{\infty}\overline{u}|^{2} d\Gamma_{h} dt.$$

$$\stackrel{\Rightarrow}{\Rightarrow} E_{h}(\overline{u}) \leq C(T) \int_{0}^{T} \int_{\Gamma_{0h}} |\partial_{n}^{h}\overline{u}|^{2} d\Gamma_{h} dt$$

Ioan Liviu Ignat (IMAR & UAM)

A Two-grid method

イロン イヨン イヨン イヨン

Sketch of the proof

$$E_{h}(\overline{u}) \leq CE_{h}(\Pi_{\gamma}\overline{u}) \leq C(T) \int_{0}^{T} \int_{\Gamma_{0h}} |\partial_{n}^{h}\Pi_{\gamma}\overline{u}|^{2} d\Gamma_{h} dt$$

$$\stackrel{?}{\leq} C(T) \int_{0}^{T} \int_{\Gamma_{0h}} |\partial_{n}^{h}\overline{u}|^{2} d\Gamma_{h} dt + LOT$$

Dyadic decomposition or Semi-classical decomposition:

$$P_k\overline{u}(t) = \sum_{\mathbf{j}\in\mathbb{Z}^2} F(c^{-k}\omega_{\mathbf{j}}(h)) \left[e^{it\omega_{\mathbf{j}}(h)}\widehat{u}_+(\mathbf{j}) + e^{-it\omega_{\mathbf{j}}(h)}\widehat{u}_-(\mathbf{j}) \right] \overline{\varphi}^{\mathbf{j}}$$

Ioan Liviu Ignat (IMAR & UAM)

イロト 不得 トイヨト イヨト 二日

$$E_{h}(\overline{u}) \lesssim E_{h}(\Pi_{\gamma}\overline{u}) \leq \sum_{k=k_{0}}^{k_{h}} E_{h}(P_{k}\overline{u}) + LOT$$

$$E_{h}(P_{k}\overline{u}) \leq C(T,\gamma,\delta) \int_{\delta}^{T-\delta} \int_{\Gamma_{0h}} |\partial_{n}^{h}P_{k}\overline{u}|^{2} d\Gamma_{0h} dt.$$
(4)

Combining (3) and (4),

$$E_h(\Pi_{\gamma}\overline{u}) \le C(T,\gamma,\delta) \sum_{k=k_0}^{k_h} \int_{\delta}^{T-\delta} \int_{\Gamma_{0h}} |\partial_n^h P_k \overline{u}|^2 d\Gamma_{0h} dt + LOT.$$

Ioan Liviu Ignat (IMAR & UAM)

3

<ロ> (日) (日) (日) (日) (日)

Lebeau and Burq :

$$\sum_{k=k_0}^{k_h} \int_{\delta}^{T-\delta} \int_{\Gamma_{0h}} |\partial_n^h P_k \overline{u}|^2 d\Gamma_{0h} dt$$
$$\leq 2 \int_0^T \int_{\Gamma_{0h}} |\partial_n^h \overline{u}|^2 d\Gamma_{0h} dt + \frac{C(\delta, T)}{c^{2k_0}} E_h(\overline{u})$$

Thus

$$\begin{split} E_{h}(\overline{u}) &\lesssim E_{h}(\Pi_{\gamma}\overline{u}) \\ &\leq C(T,\gamma,\delta) \int_{0}^{T} \int_{\Gamma_{0h}} |\partial_{n}^{h}\overline{u}|^{2} d\Gamma_{0h} dt + \frac{C(\delta,T)}{c^{2k_{0}}} E_{h}(\overline{u}) + LOT \\ & E_{h}(\overline{u}) \leq C(T,\gamma,\delta) \int_{0}^{T} \int_{\Gamma_{0h}} |\partial_{n}^{h}\overline{u}|^{2} d\Gamma_{0h} dt + LOT. \end{split}$$

<ロ> (日) (日) (日) (日) (日)

We have developed a quite systematic approach to prove the convergence of the controls obtained by two-grid methods. It relies essentially on the following ingredients:

- A convergent numerical scheme;
- The Fourier decomposition of solutions;
- The conservative nature of the model and the numerical approximation schemes under consideration;
- The uniform (with respect to the mesh size) observability of low frequency solutions.

In these circumstances, the dyadic decomposition argument can then be applied, to yield the uniform observability of the two-grid solutions.

- 3

25 / 28

イロト 人間ト イヨト イヨト

The method we employ can be adapted to

- Other models: Schrödinger equations and beam equations
- Other control mechanisms: internal observability for which the measurement on solutions is done in an open subset ω of the domain
- **Control of nonlinear wave equations.** In dimension one Zuazua proved the convergence of the two-grid algorithm for semilinear wave equations with globally Lipschitz nonlinearities
- Fully discrete schemes.

過 ト イヨ ト イヨト

Limitations of our method

- **More general meshes.** We used intensively Fourier analysis techniques, which is not available for irregular meshes, that require further developments.
- **Dissipative equations.** As we have mentioned above, our analysis is mainly valid for conservative systems. We could also consider the wave equation with a bounded dissipative potential, but the methods we have developed here can not address genuinely dissipative models as the heat equation, viscoelasticity,...
- **Dissipative schemes.** The same can be said about the numerical schemes we have considered. Our analysis applies to both semi-discrete and fully discrete conservative schemes, but not to dissipative ones...

Thanks!!!
