イロト イポト イヨト イヨト

æ

• IKKT model gives a definition for string theory IIB,

Motivation

Matrix models give a non-perturbative definition for string theory,

<ロ> (四) (四) (日) (日) (日)

æ

- IKKT model gives a definition for string theory IIB,
- BFSS matrix model definition of *M* theory,

Motivation

- Matrix models give a non-perturbative definition for string theory,
- IKKT model gives a definition for string theory IIB,
- BFSS matrix model definition of *M* theory,
- BMN matrix model is a mass deformation of the BFSS model in d = 10, admits the fuzzy sphere as a solution of its equations of motion.

<ロ> (日) (日) (日) (日) (日)

æ

Motivation

- Matrix models give a non-perturbative definition for string theory,
- IKKT model gives a definition for string theory IIB,
- BFSS matrix model definition of M theory,
- BMN matrix model is a mass deformation of the BFSS model in d = 10, admits the fuzzy sphere as a solution of its equations of motion.

<ロ> (日) (日) (日) (日) (日)

æ

 Mass deformed IKKT Yang-Mills matrix models in various dimensions admit also the fuzzy sphere as a solution.

Motivation

- Matrix models give a non-perturbative definition for string theory,
- IKKT model gives a definition for string theory IIB,
- BFSS matrix model definition of M theory,
- BMN matrix model is a mass deformation of the BFSS model in d = 10, admits the fuzzy sphere as a solution of its equations of motion.
- Mass deformed IKKT Yang-Mills matrix models in various dimensions admit also the fuzzy sphere as a solution.
- Matrix models have a very rich phase structure: D-branes, intersecting branes, etc

<ロ> (日) (日) (日) (日) (日)

- Matrix models have a very rich phase structure: D-branes, intersecting branes, etc

<ロト <回ト < 三ト

- Discretisation of supersymmetric models.
- Understand the origin of geometry as an emergent phenomena

Motivation

- Matrix models give a non-perturbative definition for string theory,
- IKKT model gives a definition for string theory IIB,
- BFSS matrix model definition of M theory,
- BMN matrix model is a mass deformation of the BFSS model in d = 10, admits the fuzzy sphere as a solution of its equations of motion.
- Mass deformed IKKT Yang-Mills matrix models in various dimensions admit also the fuzzy sphere as a solution.
- Matrix models have a very rich phase structure: D-branes, intersecting branes, etc

- Discretisation of supersymmetric models.
- Understand the origin of geometry as an emergent phenomena
- Matrix models provide an escenario to understand classical geometry as condensation of random degrees of freedom as the system evolves.

The 2-matrix model: A solvable model (Hoppe '82,Berestein,et.al. '09)

• Consider the following 2-matrix model $(X, Y \ N \times N$ Hermitian matrices)

The 2-matrix model: A solvable model (Hoppe '82,Berestein,et.al. '09)

• Consider the following 2-matrix model $(X, Y \ N \times N$ Hermitian matrices)

$$Z[g^{2}] = \int dX \ dY e^{-Tr[X^{2}+Y^{2}-g^{2}[X,Y]^{2}]}, \ dX = \prod dX_{ii} \prod_{i < j} d\mathbb{R}e(X_{ij})d\mathbb{I}m(X_{ij})$$

The 2-matrix model: A solvable model (Hoppe '82,Berestein,et.al. '09)

• Consider the following 2-matrix model (X, Y $N \times N$ Hermitian matrices)

$$Z[g^{2}] = \int dX \ dY e^{-Tr[X^{2}+Y^{2}-g^{2}[X,Y]^{2}]}, \ dX = \prod dX_{ii} \prod_{i < j} d\mathbb{R}e(X_{ij})d\mathbb{I}m(X_{ij})$$

 Exploting the fact that the model is invariant under unitary transformations; the model can be solved diagonalising the matrix X, then g²Tr[X, Y]² = 2g²Tr(XYXY - X²Y²) = -g²∑_{ij}(x_i - x_j)² |Y_{ij}|², then integrating over Y

$$Z[g^{2}] = \int dx_{1} \cdots dx_{N} e^{-\sum_{i}^{N} x_{i}^{2} + \frac{1}{2} \sum_{i \neq j} \log(x_{i} - x_{j})^{2} - \frac{1}{2} \sum_{i \neq j} \log[1 + g^{2}(x_{i} - x_{j})^{2}]}$$

The 2-matrix model: A solvable model (Hoppe '82,Berestein,et.al. '09)

• Consider the following 2-matrix model $(X, Y \ N \times N$ Hermitian matrices)

$$Z[g^{2}] = \int dX \ dY e^{-Tr[X^{2}+Y^{2}-g^{2}[X,Y]^{2}]}, \ dX = \prod dX_{ii} \prod_{i < j} d\mathbb{R}e(X_{ij})d\mathbb{I}m(X_{ij})$$

 Exploting the fact that the model is invariant under unitary transformations; the model can be solved diagonalising the matrix X, then g²Tr[X, Y]² = 2g²Tr(XYXY − X²Y²) = -g²∑_{ij}(x_i − x_j)² |Y_{ij}|², then integrating over Y

$$Z[g^{2}] = \int dx_{1} \cdots dx_{N} e^{-\sum_{i}^{N} x_{i}^{2} + \frac{1}{2} \sum_{i \neq j} \log(x_{i} - x_{j})^{2} - \frac{1}{2} \sum_{i \neq j} \log[1 + g^{2}(x_{i} - x_{j})^{2}]}$$

$$S_{eff}(x_i) = \sum_{i}^{N} x_i^2 - \frac{1}{2} \sum_{i \neq j} \log(x_i - x_j)^2 + \frac{1}{2} \sum_{i \neq j} \log[1 + g^2(x_i - x_j)^2]$$

•

The 2-matrix model: A solvable model (Hoppe '82,Berestein,et.al. '09)

• Consider the following 2-matrix model (X, Y $N \times N$ Hermitian matrices)

$$Z[g^{2}] = \int dX \ dY e^{-Tr[X^{2}+Y^{2}-g^{2}[X,Y]^{2}]}, \ dX = \prod dX_{ii} \prod_{i < j} d\mathbb{R}e(X_{ij})d\mathbb{I}m(X_{ij})$$

 Exploting the fact that the model is invariant under unitary transformations; the model can be solved diagonalising the matrix X, then g²Tr[X, Y]² = 2g²Tr(XYXY − X²Y²) = -g²∑_{ij}(x_i − x_j)² |Y_{ij}|², then integrating over Y

$$Z[g^{2}] = \int dx_{1} \cdots dx_{N} e^{-\sum_{i}^{N} x_{i}^{2} + \frac{1}{2} \sum_{i \neq j} \log(x_{i} - x_{j})^{2} - \frac{1}{2} \sum_{i \neq j} \log[1 + g^{2}(x_{i} - x_{j})^{2}]}$$

$$S_{eff}(x_i) = \sum_{i}^{N} x_i^2 - rac{1}{2} \sum_{i
eq j} \log(x_i - x_j)^2 + rac{1}{2} \sum_{i
eq j} \log[1 + g^2(x_i - x_j)^2]$$

• The saddle point equation

•

$$\frac{dS_{eff}}{dx_k} = 0 \quad \longrightarrow \quad x_i = \sum_{i \neq j} \frac{1}{(x_i - x_j)[1 + g^2(x_i - x_j)^2]}$$

The 2-matrix model

• Taking the continuum limit $\sum \rightarrow \int \rho(x) dx$ introducing $\rho(x)$ as the eigenvalue density with the normalisation condition $\int \rho(x) dx = N$ the saddle point equation in the large N limit becomes

$$x = \int \frac{\rho(y) dy}{(x - y)[1 + g^2(x - y)^2]}$$

イロト イポト イヨト イヨト

э

The 2-matrix model

• Taking the continuum limit $\sum \rightarrow \int \rho(x) dx$ introducing $\rho(x)$ as the eigenvalue density with the normalisation condition $\int \rho(x) dx = N$ the saddle point equation in the large N limit becomes

$$x = \int \frac{\rho(y) dy}{(x - y)[1 + g^2(x - y)^2]}$$

• The equation can be solved for $g^2N >> 1$, the solution for $\rho(x)$ is given by

$$\rho(x) = \frac{3N}{r^3}(r^2 - x^2).$$

イロト イポト イヨト イヨト

2

The 2-matrix model

• Taking the continuum limit $\sum \rightarrow \int \rho(x) dx$ introducing $\rho(x)$ as the eigenvalue density with the normalisation condition $\int \rho(x) dx = N$ the saddle point equation in the large N limit becomes

$$x = \int \frac{\rho(y) dy}{(x - y)[1 + g^2(x - y)^2]}$$

• The equation can be solved for $g^2N >> 1$, the solution for $\rho(x)$ is given by

$$\rho(x) = \frac{3N}{r^3}(r^2 - x^2).$$

イロト イポト イヨト イヨト

• Model is effectively described by 2N dof; the off-diagonal terms become heavy.

The 2-matrix model

• Taking the continuum limit $\sum \rightarrow \int \rho(x) dx$ introducing $\rho(x)$ as the eigenvalue density with the normalisation condition $\int \rho(x) dx = N$ the saddle point equation in the large N limit becomes

$$x = \int \frac{\rho(y) dy}{(x - y)[1 + g^2(x - y)^2]}$$

• The equation can be solved for $g^2 N >> 1$, the solution for $\rho(x)$ is given by

$$\rho(x) = \frac{3N}{r^3}(r^2 - x^2).$$

- Model is effectively described by 2N dof; the off-diagonal terms become heavy.
- Adding more matrices is possible, however the model is much more difficult to solve for the fully interacting case even in the g²N >> 1 limit.

<ロ> (日) (日) (日) (日) (日)

æ

Equations of Motion, $\delta S = 0$

$$[D_b, iF_{ab}] - 2\mu D_a = 0, \qquad \text{with} \quad F_{ab} = i[D_a, D_b] + \epsilon_{abc} D_c$$

Classical Potential Quantum Potential

イロト イポト イヨト イヨト

3

Equations of Motion, $\delta S = 0$

$$[D_b, iF_{ab}] - 2\mu D_a = 0, \qquad \text{with} \quad F_{ab} = i[D_a, D_b] + \epsilon_{abc} D_c$$

Solutions for matrix configurations

The extrema of the model are clearly given by the trivial solution $D_a = 0$ and representations of SU(2), commuting matrices are also solutions.

Classical Potential Quantum Potential

Equations of Motion, $\delta S = 0$

$$[D_b, iF_{ab}] - 2\mu D_a = 0, \qquad \text{with} \quad F_{ab} = i[D_a, D_b] + \epsilon_{abc} D_c$$

Solutions for matrix configurations

The extrema of the model are clearly given by the trivial solution $D_a = 0$ and representations of SU(2), commuting matrices are also solutions.

Ground State

The ground state of the model is given by $D_a = L_a$; irreducible representations of SU(2):

$$[L_a, L_b] = \epsilon_{abc} L_c, \text{ and } \sum_{i=1}^3 L_a^2 = \frac{N^2 - 1}{4} \mathbb{1}_N,$$

3

for which $S(D_a = L_a) = -\tilde{\alpha}^4 \frac{N^2 - 1}{4} \left(\frac{1}{6} + \mu\right).$

Classical Potential Quantum Potential

Equations of Motion, $\delta S = 0$

$$[D_b, iF_{ab}] - 2\mu D_a = 0, \qquad \text{with} \quad F_{ab} = i[D_a, D_b] + \epsilon_{abc} D_c$$

Solutions for matrix configurations

The extrema of the model are clearly given by the trivial solution $D_a = 0$ and representations of SU(2), commuting matrices are also solutions.

Ground State

The ground state of the model is given by $D_a = L_a$; irreducible representations of SU(2):

$$[L_a, L_b] = \epsilon_{abc} L_c, \text{ and } \sum_{i=1}^3 L_a^2 = \frac{N^2 - 1}{4} \mathbb{1}_N,$$

3

for which $S(D_a = L_a) = -\tilde{\alpha}^4 \frac{N^2 - 1}{4} \left(\frac{1}{6} + \mu\right).$

Classical Potential Quantum Potential

Fuzzy sphere

Fuzzy sphere

• Define a matrix $X_a = \frac{2L_a}{\sqrt{N^2-1}}$, where L_a are irreducible representations of SU(2). Then

$$[X_a, X_b] = \frac{2i\epsilon_{abc}}{\sqrt{N^2 - 1}} X_c, \text{ and } \sum_{i=1}^3 X_a^2 = \frac{N^2 - 1}{4} \mathbb{1}_N,$$

relations which define the fuzzy sphere; a finite matrix approximation for the commutative sphere. The commutative limit is when $N \to \infty$

Stability of the fuzzy sphere

We are interested in tha stability of the fuzzy sphere matrix solution. For this reason we consider the classical potential parametrising $D_a = \phi L_a$.

イロト イヨト イヨト イヨト

イロト イヨト イヨト イヨト

Classical Potential Quantum Potential

Classical Potential

 The classical potential given in terms of the configuration D_a = φL_a

$$\frac{V_{class}}{2c_2} = \tilde{\alpha} \left(\frac{1}{4} \phi^4 - \frac{1}{3} \phi^3 - \frac{\mu}{2} \phi^2 \right)$$

with $c_2 \equiv L_a^2 = S(S+1) = (N^2 - 1)/4$ is the quadratic Casimir for the *S*-irrep of *SU*(2) $(S = \frac{N-1}{2}$, the spin)

• The condition $\frac{dV_{class}}{d\phi} = 0$ gives the extrema for the potential

$$\phi = \left\{0, rac{1+\sqrt{1+4\mu}}{2}, rac{1-\sqrt{1+4\mu}}{2}
ight\}$$

For fix α̃ we can plot the potential for different values of μ. For μ = −2/9 φ = (0, 2/3, 1/3)

Eigenvalue distributions and emergent geometry

<ロ> (四) (四) (三) (三)

Geometrical Observables

Geometrical observables

- The matrices X_a and $i[X_a, X_b]$. X_a are $N \times N$ Hermitian matrices.
- The matrix $C = \sigma_a X_a$, where σ_a are the Pauli matrices. C is a $2N \times 2N$ Hermitian matrix.
- The Dirac operator D = σ_a[X_a, ·], acting on a 2N² Hilbert space.
- We will be interested in the eigenvalue distribution for all these matrices. Which is precisely the information which encodes the geometry.

Eigenvalue distributions and emergent geometry

ヘロン 人間 とくほど くほとう

3

Specific backgrounds

Fuzzy sphere

The spectrum for those matrices are known for specific backgrounds. From the equation of motion we see that the ground state is given by irrep SU(2),
 X₂ = -2L₂/2. Then

$$X_a = \frac{2L_a}{\sqrt{N^2 - 1}}$$
. The

$$[X_a, X_b] = \frac{2i\epsilon_{abc}}{\sqrt{N^2 - 1}} X_c, \text{ and } \sum_{i=1}^3 X_a^2 = \frac{N^2 - 1}{4} \mathbb{1}_N,$$

relations which define the fuzzy sphere; a finite matrix approximation for the commutative sphere. The commutative limit is when $N \to \infty$

- In this case we have $C = \left(\pm \frac{N}{2} \frac{1}{2}\right) \mathbb{1}_N$
- and spec $\{\mathcal{D}\} = \{-N, -(N-1), \dots, -3, -2, 0, 1, 2, 3, \dots, (N-1)\}$

Eigenvalue distributions

Consider the model

$$S[D] = \frac{\tilde{\alpha}^4}{N} \operatorname{Tr} \left[-\frac{1}{4} [D_a, D_b]^2 + \frac{i}{3} \epsilon_{abc} [D_a D_b] D_c - \mu D_a^2 \right],$$

• The critical line $\tilde{\alpha}(\mu)_*$ defines two phases; the low temperature phase where the underlying geometry is a fuzzy sphere and a the high temperature phase or matrix phase.

From random matrices to geometry

We emphasize that we start from a random matrix configuration and then the system is brought into the equilibrium and is when we measure the distributions.

Keep in mind the series of approximations have been made to derive the effective potential and its consecuences; one-loop calculation, N large limit

- Lets see the effect of the parameter μ on X_a
- The effect of μ in the fuzzy sphere is to squeeze the configuration
- Eventually the μ_{*} is reached and the fuzzy sphere dissapears and a commutative sphere with fixed radius pops up!

- Lets see the effect of the parameter μ on X_a
- The effect of μ in the fuzzy sphere is to squeeze the configuration
- Eventually the μ_{*} is reached and the fuzzy sphere dissapears and a commutative sphere with fixed radius pops up!
- $C = \sigma_a X_a$

Eigenvalue distributions and emergent geometry

- Lets see the effect of the parameter μ on X_a
- The effect of μ in the fuzzy sphere is to squeeze the configuration
- Eventually the µ* is reached and the fuzzy sphere dissapears and a commutative sphere with fixed radius pops up!

•
$$C = \sigma_a X_a$$

Eigenvalue distributions and emergent geometry

- Lets see the effect of the parameter μ on X_a
- The effect of μ in the fuzzy sphere is to squeeze the configuration
- Eventually the μ_{*} is reached and the fuzzy sphere dissapears and a commutative sphere with fixed radius pops up!
- $C = \sigma_a X_a$
- The transition is that of a non-commutative sphere to a commutative sphere of radius 2.

Conclusions

- We have shown a simple example of how geometry emerges dynamically from matrix models.
- Starting from a matrix model with no background geometry, random degrees of freedom condensate under the effect of quantum fluctuations giving origin to geometry.
- The geometry in matrix models is then understood as an emergent concept.
- In this concrete example, in the matrix phase or high temperature phase the matrices are effectively commutative and dominated by diagonal elements which form a solid ball.
- The low temperature phase has an non-commutative sphere as underlying geometry, the fuzzy sphere.
- The transition observed is that of a non-commutative sphere to a commutative sphere of radius 2.
- It is believed that such transitions belong to a new universality class.
- The excellent agreement of theoretical predictions and simulations suggest the existence of an exact solution for this type of matrix models.
